

Introduction

There may be times when you want to apply some styles to many elements. You could write

```
h1 {color: red}  
h2 {color: red}  
h3 {color: red}
```

But that's not very efficient. Use multiple selector instead:

```
h1, h2, h3 {color: red}
```

There is one catch however. You can write a series of selector and they can all be separated with a comma but you cannot have a comma after the last selector. If you do, the entire rule will be ignored.

Exercise

Open up the *styles.css* file that has some styles already defined. There are a bunch of different selectors, styling h1 through to h6, however, they all have exactly the same declaration applied. So we could write that much more efficiently:

```
h1, h2, h3, h4, h5, h6 { border: 1px solid red; }
```
