

Introduction

Now let's discuss **class selectors**. Class selector is written with a full stop followed by the class name value:

```
.intro {color: red}
```

It's important to remember that CSS class names are case sensitive, so the two examples below would be treated differently by browsers:

```
.intro {}  
.INTRO {}
```

Class selectors are well supported across all modern browsers.

Exercise

Let's style our container. The selector would be "dot" for class and then "container":

```
.container  
{  
  width: 50em;  
  margin-left: auto;  
  margin-right: auto;  
}
```

By setting the margin-left and margin-right to auto, we are centering the container in the viewport.

Now style another class:

```
.nav  
{  
  padding: 1em 2em;  
  background: green;  
}
```

Now our `.nav` element has some padding and a green background.

Now for another class:

```
.intro
{
  font-size: 1.2em;
  color: gray;
}
```
