

Introduction

The next topic is **adjacent sibling selectors**. Adjacent sibling selectors are written with a selector that is separated by a plus symbol:

```
h2 + h3 {}
```

In this example we're looking for any h3 that comes directly after an h2 and that they're all siblings, meaning they come from the same parent.

The adjacent sibling selector is not supported by IE6.

Exercise

We will style an h4 that comes directly after an h3:

```
h3 + h4 { margin-top: 2em; }
```

We could have assigned that h4 some class, but this solution seems to be more elegant. We are looking for any h4, but only one that comes after, directly after h3 and that both have the same parent.
