

## Introduction @media method

The second method we'll look at is the `@import` method. `@import` rules can be written in five different ways, but they're all trying to achieve the same result.

```
@import 'a.css';  
@import "a.css";  
@import url(a.css);  
@import url('a.css');  
@import url("a.css");
```

We're trying to import another CSS file into the original CSS file. In all these examples, we're importing `a.css` into the CSS file.

## Exercise

For this exercise, we only need to look at two CSS files. The first one is `print.css` and what we want to do is to write an `@import` rule to import this stylesheet into another one.

`@import` rules should be written in the very first line of your CSS, otherwise, they can be totally ignored.

```
@import url(print.css) screen, print;
```

We set the media type as well. These rules aren't actually being imported into our `styles.css` file, but from a browser's perspective it's as if they were. Browsers will treat these add imports as if those rules were placed inside this original CSS file.
