Introduction

In this step we're going to continue with the header section and take care of the top section.

Styling Navigation section

We will use mixins from the *grid.less* file which is the Semantic Grid system.

```less
header {
  background: url("@{bg}skyline_ny.jpg");
  background-size: cover;
  height: 500px;

  #topbar {
    .bar;
        h2 {
            .column(6);
            padding-top: @padding/2;
            color: darken(@asbestos, 20%);
        }
    nav {
        .column(6);
        float: right;
        ul {
            .reset;
            li {
                display: inline-block;
                width: 5rem;
                margin: @margin;
                text-align: center;
                    a {
                        #navigation > .links();
                    }
            }
        }
    }
    .clearfix();
        }
    }
}
```

`bar` includes a collection of CSS properties that we're going to need to design at the to pbar in the header section.

Using `column` we create the two-column layout. It accepts values between 1 and 12 in order to create the columns. By providing `6` for each elements we get two columns of an equal width.

The `clearfix` is used to fix problems caused by `float`.

Check the result in your browser!
